Once melanoma diagnosis has been established, an innovative molecular assay that can be used to help in the prognosis is the Decision-Dx melanoma gene expression profiling test (Castle Biosciences). Prognosis requires traditional staging and includes looking at parameters like Breslow depth and mitotic index to help clinicians discern whether a ...

Adjunct molecular tests aid melanoma diagnosis

In 2011 the US FDA approved vemurafenib for the treatment of metastatic melanoma patients with a BRAF V600 mutation, along with the Cobas 4800 companion diagnostic test, both from Roche. This real time PCR test is focused on the qualitative detection of the BRAF V600E mutation.

Arguably, most of the recent attention concerning molecular cancer diagnostics in the clinical setting has been focused on predictive biomarkers of response to therapy, such as KRAS mutations in metastatic colorectal cancer (mCRC),^{12,13} EGFR mutations in advanced NSCLC,^{14,15,16} and BRAF mutations in metastatic malignant melanoma.^{17,18} The presence or absence of these predictive markers is directly linked to the response rates of particular targeted therapies with small-molecule kinase ...
